## Double Distributions. Relation to Generalized Parton Distributions.

Representation of GPD:

Infu EA - Saclay

### Proton tomography

### Definitions

Physical content Formalism

### Modeling

Double Distributions Overlap Radon transform Covariant extension

## Experimental data analysis

Experimental access DVCS Kinematics Towards 3D images

Conclusion

 $H^{q}(x,\xi,t) = \int_{\Omega_{\rm DD}} \mathrm{d}\beta \mathrm{d}\alpha \,\delta(x-\beta-\alpha\xi) \left(F^{q}(\beta,\alpha,t) + \xi G^{q}(\beta,\alpha,t)\right)$ 

- Support property:  $x \in [-1, +1]$ .
- Discrete symmetries:  $F^q$  is  $\alpha$ -even and  $G^q$  is  $\alpha$ -odd.
- **Gauge**: any representation  $(F^q, G^q)$  can be recast in one representation with a single DD  $f^q$ :

$$H^{q}(x,\xi,t) = x \int_{\Omega_{\rm DD}} \mathrm{d}\beta \mathrm{d}\alpha \, f^{q}_{\rm BMKS}(\beta,\alpha,t) \delta(x-\beta-\alpha\xi)$$

Belitsky et al., Phys. Rev. D64, 116002 (2001)  $H^{q}(x,\xi,t) = (1-x) \int_{\Omega_{\text{DD}}} \mathrm{d}\beta \mathrm{d}\alpha \, f_{\text{P}}^{q}(\beta,\alpha,t) \delta(x-\beta-\alpha\xi)$

Conclusion

• Derive an expression for the pion GPD in the DGLAP region 
$$\xi \le x \le 1$$
:

$$f(\mathbf{x},\xi,t) \propto \sum_{\beta,j} \int [\mathrm{d}\bar{\mathbf{x}}\mathrm{d}\bar{\mathbf{k}}_{\perp}]_N \delta_{j,q} \delta(\mathbf{x}-\bar{\mathbf{x}}_j) (\psi_N^{(\beta,\lambda)})^* (\hat{\mathbf{x}}',\hat{\mathbf{k}}'_{\perp}) \psi_N^{(\beta,\lambda)}(\tilde{\mathbf{x}},\tilde{\mathbf{k}}_{\perp})$$

with  $\tilde{x}, \tilde{\mathbf{k}}_{\perp}$  (resp.  $\hat{x}', \hat{\mathbf{k}}'_{\perp}$ ) generically denoting incoming (resp. outgoing) parton kinematics.

### Diehl et al., Nucl. Phys. B596, 33 (2001)

Similar expression in the ERBL region  $-\xi \le x \le \xi$ , but with overlap of *N*- and (N+2)-body LFWFs.

### Overlap representation. Advantages and drawbacks.

#### Overlap

Radon transform Covariant extension

### Experimental data analysis

Experimental access DVCS Kinematics Towards 3D images

#### Conclusion

■ Implementation of symmetries of *N*-body problems.

### What is not obvious anymore

What is *not* obvious to see from the wave function representation is however the **continuity of GPDs at**  $x = \pm \xi$ and the **polynomiality** condition. In these cases both the DGLAP and the ERBL regions must cooperate to lead to the required properties, and this implies **nontrivial relations between the wave functions** for the different Fock states relevant in the two regions. An *ad hoc* Ansatz for the wave functions would **almost certainly lead** to GPDs that **violate the above requirements**.

### Diehl, Phys. Rept. 388, 41 (2003)

### The Radon transform. Definition and properties.

For s > 0 and  $\phi \in [0, 2\pi]$ :

 $\mathcal{R}f(s,\phi) = \int_{-\infty}^{+\infty} \mathrm{d}\beta \mathrm{d}\alpha \, f(\beta,\alpha) \delta(s-\beta\cos\phi-\alpha\sin\phi)$ 

and:

$$\mathcal{R}f(-s,\phi) = \mathcal{R}f(s,\phi\pm\pi)$$

Relation to GPDs:

$$x = \frac{s}{\cos \phi} \text{ and } \xi = \tan \phi$$

#### Relation between GPD and DD in Belistky et al. gauge

$$\frac{\sqrt{1+\xi^2}}{x}H(x,\xi) = \mathcal{R}f_{\rm BMKS}(s,\phi) ,$$

#### Conclusion

Let f be a compactly-supported locally summable function defined on  $\mathbb{R}^2$  and  $\mathcal{R}$ f its Radon transform. Let  $(s_0, \omega_0) \in \mathbb{R} \times S^1$  and  $U_0$  an open neighborhood of  $\omega_0$  such that:

for all  $s > s_0$  and  $\omega \in U_0$   $\mathcal{R}f(s, \omega) = 0$ .

Then  $f(\aleph) = 0$  on the half-plane  $\langle \aleph | \omega_0 \rangle > s_0$  of  $\mathbb{R}^2$ .

Consider a GPD H being zero on the DGLAP region.

- Take  $\phi_0$  and  $s_0$  s.t.  $\cos \phi_0 \neq 0$  and  $|s_0| > |\sin \phi_0|$ .
- Neighborhood  $U_0$  of  $\phi_0$  s.t.  $\forall \phi \in U_0 | \sin \phi | < |s_0|$ .
- The underlying DD f has a zero Radon transform for all  $\phi \in U_0$  and  $s > s_0$  (DGLAP).
- Then  $f(\beta, \alpha) = 0$  for all  $(\beta, \alpha) \in \Omega_{DD}$  with  $\beta \neq 0$ .
- Extension **unique** up to adding a **D-term**:  $\delta(\beta)D(\alpha)$ .

### Computation of the extension. Numerical evaluation of the inverse Radon transform.

#### Proton tomography

#### Motivation

Definitions

Physical content Formalism

#### Modeling

Double Distributions Overlap Radon transform Covariant extension

### Experimental data analysis

Experimental access DVCS Kinematics Towards 3D images

Conclusion

### Fully discrete case

Assume f piecewise-constant with values  $f_m$  for  $1 \le m \le M$ . For a collection of lines  $(L_n)_{1 \le n \le N}$  crossing  $\Omega_{DD}$ , the Radon transform writes:

$$g_n = \mathcal{R}f = \int_{L_n} f = \sum_{m=1}^M f_m \times \text{Measure}(L_n \cap C_m) \quad \text{ for } 1 \le n \le N$$

### And if the input data are inconsistent?

Instead of solving  $g = \mathcal{R}f$ , find f such that  $||g - \mathcal{R}f||_2$  is **minimum**.

H. Moutarde

DROITE workshop

18 / 29

- The solution **always exists**.
- The input data are **inconsistent** if  $||g \mathcal{R}f||_2 > 0$ .

## Experimental data analysis

Experimental access DVCS Kinematics Towards 3D images

Conclusion

### Bjorken regime : large $Q^2$ and fixed $xB \simeq 2\xi/(1+\xi)$

- Partonic interpretation relies on **factorization theorems**.
- All-order proofs for DVCS, TCS and some DVMP.
- GPDs depend on a (arbitrary) factorization scale  $\mu_F$ .
  - **Consistency** requires the study of **different channels**.
- GPDs enter DVCS through **Compton Form Factors** :

$$\mathcal{F}(\xi, t, Q^2) = \int_{-1}^{1} dx C\left(x, \xi, \alpha_{\mathcal{S}}(\mu_{\mathcal{F}}), \frac{Q}{\mu_{\mathcal{F}}}\right) F(x, \xi, t, \mu_{\mathcal{F}})$$

for a given GPD *F*.

• CFF  $\mathcal{F}$  is a **complex function**.

### Conclusions and prospects. Two problems with important practical consequences.

#### Proton tomography

#### Motivation

- Definitions
- Physical content Formalism

#### Modeling

Double Distributions Overlap Radon transform Covariant extension

### Experimental data analysis

Experimental access DVCS Kinematics Towards 3D images

- **Good theoretical control** on the path between GPD models and experimental data.
- Success of physics program requires new GPD models with proper implementations of symmetries.
- Inverse Radon transform is essential to build models fulfilling *a priori* all theoretical constraints in a generic way.
- The solution of the **deconvolution problem** may follow.
